Data Streams: Algorithms and Applications (Foundations and Trends in Theoretical Computer Science,) S. Muthukrishnan

Data stream algorithms as an active research agenda emerged only over the past few years, even though the concept of making few passes over the data for performing computations has been around since the early days of Automata Theory. The data stream agenda now pervades many branches of Computer Science including databases, networking, knowledge discovery and data mining, and hardware systems. Industry is in synch too, with Data Stream Management Systems (DSMSs) and special hardware to deal with data speeds. Even beyond Computer Science, data stream concerns are emerging in physics, atmospheric science and statistics. Data Streams: Algorithms and Applications focuses on the algorithmic foundations of data streaming. In the data stream scenario, input arrives very rapidly and there is limited memory to store the input. Algorithms have to work with one or few passes over the data, space less than linear in the input size or time significantly less than the input size. In the past few years, a new theory has emerged for reasoning about algorithms that work within these constraints on space, time and number of passes. Some of the methods rely on metric embeddings, pseudo-random computations, sparse approximation theory and communication complexity. The applications for this scenario include IP network traffic analysis, mining text message streams and processing massive data sets in general. Data Streams: Algorithms and Applications surveys the emerging area of algorithms for processing data streams and associated applications. An extensive bibliography with over 200 entries points the reader to further resources for exploration.

Reading a book being new life style in this season; every people loves to read a book. When you study a book you can get a lot of benefit. When you read publications, you can improve your knowledge, because book has a lot of information upon it. The information that you will get depend on what sorts of book that you have read. If you need to get information about your examine, you can read education books, but if you act like you want to entertain yourself look for a fiction books, these kinds of us novel, comics, and also soon. The Data Streams: Algorithms and Applications (Foundations and Trends in Theoretical Computer Science,) provide you with new experience in reading through a book.

James Lightle:

As we know that book is very important thing to add our information for everything. By a guide we can know everything you want. A book is a set of written, printed, illustrated or blank sheet. Every year ended up being exactly added. This reserve Data Streams: Algorithms and Applications (Foundations and Trends in
